Full scale collaborative trial on the methods for the determination of ethephon in TC, TK and SL

1. Ethepron description

ISO common name

No ISO common name. The common name of ethephon was approved by American National Standards Institute (ANSI).

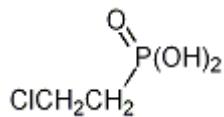

Synonyms

none

Chemical name(s)

IUPAC (R)-2-[4-(6-chlorobenzoxazol-2-yloxy)phenoxy]propionic acid ethyl ester CA
ethyl (R)-2-[4-[(6-chloro-2-benzoxazoly)oxy]phenoxy]propanoate

Structural formula

Molecular formula

C₂H₆ClO₃P

Relative molecular mass

144.5

CAS Registry number

16672-87-0

CIPAC number

373

2. Ethepron method description

2.1 Outline of method

The content of ethephon is determined by ion chromatography using sodium carbonate and sodium hydrogen carbonate as eluent.

2.2 Apparatus and reagents

High performance ion chromatograph equipped with an electrolytic conductivity detector and an injection system capable of injecting 25 µl.

Electronic integrator or data system

Ion Exchange column: Dionex IonPac AS23, 250 x 4.0 mm (i.d.), or equivalent

Guard column: Dionex IonPac AG23, 50 x 4.0 mm (i.d.), or equivalent.

Analytical balance, accurate to ± 0.1 mg

Sodium carbonate: AR or GR

Sodium hydrogen carbonate: AR or GR

Ultrapure water

2. 3 IC condition

Eluent: $7.2 \text{ mMNa}_2\text{CO}_3 + 9.0 \text{ mM NaHCO}_3$

Flow rate: 1.0 mL/min

Current of inhibitor: 70 mA

Temperature of detector cell: 35°C

Temperature of column: 30°C

Mode of injection: PushFull

Volume of Injection: 25 μ L

Frequency of data sampling: 5.0 Hz

Run time: 13 min

Retention time: 9.5 min

2. 4 Procedure

(i) Preparation of Calibration solution. Prepare calibration solutions in duplicate.

Weigh (to the nearest 0.1 mg) sufficient reference standard (w mg) to contain about 120 mg (ideally between 112 and 130 mg) of Ethepron into a volumetric flask (100 ml). Add ultrapure water to the mark and mix thoroughly. Transfer 5.00 mL of the above solution into a 50 mL volumetric flask, add ultrapure water to the mark and mix thoroughly. (Calibration solutions CA and CB).

(ii) Preparation of Ethepron sample. Prepare sample solutions in duplicate for each sample. Weigh (to the nearest 0.1 mg) sufficient sample (w mg) to contain about 120 mg (ideally between 112 and 130 mg) of Ethepron into a volumetric flask (100 ml) (for TC, melt the sample at 95°C until the sample becomes a transparent liquid and mix well). Add ultrapure water to the mark and mix thoroughly. Transfer 5.00 mL of the above solution into a 50 mL volumetric flask, add ultrapure water to the mark and mix thoroughly. (Sample

solutions S1 and S2). Filter through 0.2 µm filter before use.

(iii) Determination of ethephon

- (a) Equilibration of the system. Pump sufficient mobile phase through the column to equilibrate the system. Inject 25 µl portion of calibration solution CA until the response obtained from two consecutive injections deviate by less than 1.5%. Then inject 25 µl portion of calibration solution CB. The response factor for this solution should not deviate by more than 1.5% from that for calibration solution CA, otherwise prepare new calibration solutions.
- (b) Determination. Inject in duplicate 25 µl portions of each sample solution bracketing them by injections of the calibration solutions as follows: calibration solution CA, sample solution S1, sample solution S1, calibration solution CB, sample solution S2, sample solution S2, calibration solution CA, and so on. Measure the relevant peak areas.

(iv) Calculation

Determine the peak area of Ethephon and calculate the mean value of response factors from the calibration solutions bracketing the injections of the sample solutions and use this value for calculating the Ethephon content of the bracketed sample solutions. The Ethephon content is the mean value of two sample solutions.

$$f_i = \frac{s \times P}{H_s}$$

$$\text{Ethephon content} = \frac{f \times H_w}{w} \text{ g/kg}$$

where:

- f_i = individual response factor
- f = mean response factor of bracketing calibration injections
- H_s = peak area of Ethephon in the calibration solution
- H_w = peak area of Ethephon in the sample solution
- s = mass of Ethephon reference standard in the calibration solution (mg)
- w = mass of sample taken (mg)
- P = purity of Ethephon reference standard (g/kg)

3. Participants and sample distribution

Participants

| Name of Laboratory | Country | Address | Contact |
|---|---------|---|---------------------------------|
| Bayer AG, Product Chemistry Analytics 1 | Germany | Building 6510, 2.08 40789 Monheim, Germany | Dr. André Althoff |
| Laboratory for Quality Control of Pesticides National Phytosanitary Authority | Romania | 11 Voluntari Bd. VOLUNTARI Romania | Ciotea Florentina |

Sample information

| Sample | Quantity | Batch | Declared Content of AI |
|--------------|----------|------------|------------------------|
| ethephon TC1 | 50 g | E202105089 | Min. 93% |
| ethephon TC2 | 50 g | E202105091 | Min. 93% |
| ethephon TK1 | 50 mL | F202105089 | 75% |
| ethephon TK2 | 50 mL | F202105091 | 75% |
| ethephon SL1 | 50 mL | 202105089 | 40% |
| ethephon SL2 | 50 mL | 202105091 | 40% |

4. Deviations and remarks

Deviations:

Lab 4 set the temperatures of detector cell and column to room temperature, instead of 35°C and 30°C.

Lab 8 set the temperature of detector cell to 30°C, instead of 35°C.

Lab10 used AS18 column, which is not AS23, and the flow rate was 0.34 mL/min.

Lab 12 used a flow rate was 0.7 mL/min, and the temperatures of detector cell and column were 40°C and 45°C, instead of 35°C and 30°C.

Lab14 used AS18 column, which is not AS23, and the eluent was 23.0 mM KOH, instead of 7.2mM Na₂CO₃ + 9.0 mM NaHCO₃.

Because the deviations of Lab 14 were significant, and its results contained multi-outliers, it was excluded from further statistical analysis.

Comments:

Two laboratories commented on the sampling method of TC: The samples could solidify

quickly if taken out of water bath for weighing, so it had better been kept in the water bath during weighing. An improvement to the sampling method may be considered.

5. Statistical evaluation

Using Grubb's test, a result for TC-1 from Lab13 was straggler, and a result for TC-2 from Lab13 was outlier. The data for TC-1 and TC-2 from Lab13 were eliminated, and a Grubb's test was run again. No straggler or outlier was found after the elimination. The analytical data for TC-1 and TC-2 after elimination is provided in Table 13.

6. Conclusion

Fourteen different laboratories participated in this collaborative study. The analytical procedures from 1 laboratory significantly deviated from the proposed method, and multiple outliers were found in its results. Thus the results were excluded from statistical analysis. The results of the other laboratories are provided in Tables 1-6, and the statistical summary is included in Tables 7-12. The results for the samples evaluated are illustrated in Figures 1-6.

After Grubb's test, data for TC1 and TC2 from Lab 13 were found to contain outliers, so the data were re-analyzed after the outliers were omitted. These results were provided in Table 13.

Without elimination of any outliers or stragglers, the between lab experimental Relative Reproducibility Standard Deviation (% RSD_R) values of all six samples are below the calculated acceptable values based on the Horwitz curve calculation (% RSD_R (Hor)). With elimination of the outliers and stragglers, the % RSD_R is below % RSD_R (Hor) in all samples. The minimum number of considered results after elimination of stragglers and outliers was twelve. Horwitz ratio values obtained for this ethephon method collaborative trial are between 0.3 and 1.0, and considered acceptable.

Therefore, we consider this ethephon method as presented to be suitable. We recommend accepting this method as a provisional CIPAC method for the determination of ethephon in technical (TC and TK) and its associated formulated products (SL).
